ELITE SERIES INDUSTRIAL
AC SLIDE GATE OPERATOR

INSTALLATION MANUAL

Model SL585

SL585101U
1 HP, 120/208-240 Vac Single Phase

SL585103U
1 HP, 208-240/480 Vac Three Phase

SL585105U
1 HP, 575 Vac Three Phase

SL585151U
1-1/2 HP, 120/208-240 Vac Single Phase

SL585501U
1/2 HP, 120/208-240 Vac Single Phase

SL585503U
1/2 HP, 208-240/480 Vac Three Phase

SL585505U
1/2 HP, 575 Vac Three Phase

- THIS PRODUCT IS TO BE INSTALLED AND SERVICED BY A TRAINED GATE SYSTEMS TECHNICIAN ONLY.
- This model is for use on vehicular passage gates ONLY and not intended for use on pedestrian passage gates.
- This model is intended for use in Class I, II, III and IV vehicular slide gate applications.
- Visit LiftMaster.com to locate a professional installing dealer in your area.
- This gate operator is compatible with MyQ® and Security+ 2.0™ accessories.

SAFETY SYMBOL AND SIGNAL WORD REVIEW

When you see these Safety Symbols and Signal Words on the following pages, they will alert you to the possibility of **Serious Injury or Death** if you do not comply with the warnings that accompany them. The hazard may come from something mechanical or from electric shock. Read the warnings carefully.

When you see this Signal Word on the following pages, it will alert you to the possibility of damage to your gate and/or the gate operator if you do not comply with the cautionary statements that accompany it. Read them carefully.

**IMPORTANT NOTE:**

- **BEFORE attempting to install, operate or maintain the operator, you must read and fully understand this manual and follow all safety instructions.**
- **DO NOT attempt repair or service of your gate operator unless you are an Authorized Service Technician.**
SAFETY

USAGE CLASS

CLASS I – RESIDENTIAL VEHICULAR GATE OPERATOR
A vehicular gate operator (or system) intended for use in garages or parking areas associated with a residence of one-to four single families.

CLASS II – COMMERCIAL/GENERAL ACCESS VEHICULAR GATE OPERATOR
A vehicular gate operator (or system) intended for use in a commercial location or building such as a multi-family housing unit (five or more single family units), hotel, garages, retail store, or other buildings accessible by or servicing the general public.

CLASS III – INDUSTRIAL/LIMITED ACCESS VEHICULAR GATE OPERATOR
A vehicular gate operator (or system) intended for use in an industrial location or building such as a factory or loading dock area or other locations not accessible by or intended to service the general public.

CLASS IV – RESTRICTED ACCESS VEHICULAR GATE OPERATOR
A vehicular gate operator (or system) intended for use in a guarded industrial location or building such as an airport security area or other restricted access locations not servicing the general public, in which unauthorized access is prevented via supervision by security personnel.

UL325 ENTRAPMENT PROTECTION REQUIREMENTS

This vehicular gate operator must be installed with at least two independent entrapment protection means as specified in the table below.

<table>
<thead>
<tr>
<th>HORIZONTAL SLIDE AND SWING GATE OPERATOR</th>
</tr>
</thead>
<tbody>
<tr>
<td>GATE OPERATOR ENTRAPMENT PROTECTION TYPES</td>
</tr>
<tr>
<td>Type A</td>
</tr>
<tr>
<td>Type B1</td>
</tr>
<tr>
<td>Type B2</td>
</tr>
</tbody>
</table>

The same type of device shall not be used for both entrapment protection means. Use of a single device to cover both the opening and closing directions is in accordance with the requirement; however, a single device is not required to cover both directions. This operator is provided with Type A. The installer is required to install additional entrapment protection devices in each entrapment zone.

IMPORTANT SAFETY INFORMATION

⚠️ WARNING
To reduce the risk of INJURY or DEATH:
- READ AND FOLLOW ALL INSTRUCTIONS.
- NEVER let children operate or play with gate controls. Keep the remote control away from children.
- ALWAYS keep people and objects away from the gate. NO ONE SHOULD CROSS THE PATH OF THE MOVING GATE.
- Test the gate operator monthly. The gate MUST reverse on contact with a rigid object or reverse when an object activates the non-contact sensors. After adjusting the force or the limit of travel, retest the gate operator. Failure to adjust and retest the gate operator properly can increase the risk of INJURY or DEATH.
- Use the emergency release ONLY when the gate is not moving.
- KEEP GATES PROPERLY MAINTAINED. Read the owner’s manual. Have a qualified service person make repairs to gate hardware.
- The entrance is for vehicles ONLY. Pedestrians MUST use separate entrance.
- SAVE THESE INSTRUCTIONS.
SAFETY INSTALLATION INFORMATION

1. Vehicular gate systems provide convenience and security. Gate systems are comprised of many component parts. The gate operator is only one component. Each gate system is specifically designed for an individual application.

2. Gate operating system designers, installers and users must take into account the possible hazards associated with each individual application. Improperly designed, installed or maintained systems can create risks for the user as well as the bystander. Gate systems design and installation must reduce public exposure to potential hazards.

3. A gate operator can create high levels of force in its function as a component part of a gate system. Therefore, safety features must be incorporated into every design. Specific safety features include:
   - Edges Sensors (contact)
   - Guards for Exposed Rollers
   - Photoelectric Sensors
   - Screen Mesh
   - Vertical Posts
   - Instructional and Precautionary Signage

4. Install the gate operator only when:
   a. The operator is appropriate for the construction and the usage class of the gate.
   b. All openings of a horizontal slide gate are guarded or screened from the bottom of the gate to a minimum of 6 feet (1.8 m) above the ground to prevent a 2-1/4 inches (6 cm) diameter sphere from passing through the openings anywhere in the gate, and in that portion of the adjacent fence that the gate covers in the open position.
   c. All exposed pinch points are eliminated or guarded, and guarding is supplied for exposed rollers.

5. The operator is intended for installation only on gates used for vehicles. Pedestrians must be supplied with a separate access opening. The pedestrian access opening shall be designed to promote pedestrian usage. Locate the gate such that persons will not come in contact with the vehicular gate during the entire path of travel of the vehicular gate.

6. The gate must be installed in a location so that enough clearance is supplied between the gate and adjacent structures when opening and closing to reduce the risk of entrapment. Swinging gates shall not open into public access areas.

7. The gate must be properly installed and work freely in both directions prior to the installation of the gate operator.

8. Controls intended for user activation must be located at least 6 feet (1.8 m) away from any moving part of the gate and where the user is prevented from reaching over, under, around or through the gate to operate the controls. Outdoor or easily accessible controls shall have a security feature to prevent unauthorized use.
   Exception: Emergency access controls only accessible by authorized personnel (e.g. fire, police) may be placed at any location in the line-of-sight of the gate.

9. The Stop and/or Reset (if provided separately) must be located in the line-of-sight of the gate. Activation of the reset control shall not cause the operator to start.

10. A minimum of two (2) WARNING SIGNS shall be installed, one on each side of the gate where easily visible.

11. For a gate operator utilizing a non-contact sensor:
   a. Reference owner’s manual regarding placement of non-contact sensor for each type of application. See Install Entrapment Protection section.
   b. Care shall be exercised to reduce the risk of nuisance tripping, such as when a vehicle trips the sensor while the gate is still moving.
   c. One or more non-contact sensors shall be located where the risk of entrapment or obstruction exists, such as the perimeter reachable by a moving gate or barrier.

12. For a gate operator utilizing a contact sensor such as an edge sensor:
   a. One or more contact sensors shall be located where the risk of entrapment or obstruction exists, such as at the leading edge, trailing edge and post mounted both inside and outside of a vehicular horizontal slide gate.
   b. A hard wired contact sensor shall be located and its wiring arranged so the communication between the sensor and the gate operator is not subject to mechanical damage.
   c. A wireless device such as one that transmits radio frequency (RF) signals to the gate operator for entrapment protection functions shall be located where the transmission of the signals are not obstructed or impeded by building structures, natural landscaping or similar obstruction. A wireless device shall function under the intended end-use conditions.
   d. One or more contact sensors shall be located on the inside and outside leading edge of a swing gate. Additionally, if the bottom edge of a swing gate is greater than 6 inches (152 mm) above the ground at any point in its arc of travel, one or more contact sensors shall be located on the bottom edge.
   e. One or more contact sensors shall be located at the bottom edge of a vertical barrier (arm).
GATE CONSTRUCTION INFORMATION

Vehicular gates should be installed in accordance with ASTM F2200: Standard Specification for Automated Vehicular Gate Construction. For a copy, contact ASTM directly at 610-832-9585 or www.astm.org.

1. GENERAL REQUIREMENTS

1.1 Gates shall be constructed in accordance with the provisions given for the appropriate gate type listed, refer to ASTM F2200 for additional gate types.

1.2 Gates shall be designed, constructed and installed to not fall over more than 45 degrees from the vertical plane, when a gate is detached from the supporting hardware.

1.3 Gates shall have smooth bottom edges, with vertical bottom edged protrusions not exceeding 0.50 inches (12.7 mm) when other than the exceptions listed in ASTM F2200.

1.4 The minimum height for barbed tape shall not be less than 8 feet (2.44 m) above grade and for barbed wire shall not be less than 6 feet (1.83 m) above grade.

1.5 An existing gate latch shall be disabled when a manually operated gate is retrofitted with a powered gate operator.

1.6 A gate latch shall not be installed on an automatically operated gate.

1.7 Protrusions shall not be permitted on any gate, refer to ASTM F2200 for Exceptions.

1.8 Gates shall be designed, constructed and installed such that their movement shall not be initiated by gravity when an automatic operator is disconnected, in accordance with the following.

1.8.1 Vehicular horizontal slide gate. Shall not result in continuous, unimpeded movement in either lineal direction of its travel.

1.8.2 Vehicular horizontal swing gate. Shall not result in continuous, unimpeded movement in either direction along the arc of its path of travel.

1.9 For pedestrian access in the vicinity of an automated vehicular gate, a separate pedestrian gate shall be provided. The pedestrian gate shall be installed in a location such that a pedestrian shall not come in contact with a moving vehicular access gate. A pedestrian gate shall not be incorporated into an automated vehicular gate panel.

2. SPECIFIC APPLICATIONS

2.1 Any non-automated gate that is to be automated shall be upgraded to conform to the provisions of this specification.

2.2 This specification shall not apply to gates generally used for pedestrian access and to vehicular gates not to be automated.

2.3 Any existing automated gate, when the operator requires replacement, shall be upgraded to conform to the provisions of this specification in effect at that time.

3. VEHICULAR HORIZONTAL SLIDE GATES

3.1 The following provisions shall apply to Class I, Class II and Class III vehicular horizontal slide gates:

3.1.1 All weight bearing exposed rollers 8 feet (2.44 m), or less, above grade shall be guarded or covered.

3.1.2 All openings shall be designed, guarded, or screened from the bottom of the gate to the top of the gate or a minimum of 72 in. (1.83 m) above grade, whichever is less, to prevent a 2 1/4 in. (57 mm) diameter sphere from passing through the openings anywhere in the gate, and in that portion of the adjacent fence that the gate covers in the open position. The gate panel shall include the entire section of the moving gate, including any back frame or counterbalance portion of the gate.

3.1.3 A gap, measured in the horizontal plane parallel to the roadway, between a fixed stationary object nearest the roadway, (such as a gate support post) and the gate frame when the gate is in either the fully open position or the fully closed position, shall not exceed 2 1/4 inches (57 mm), refer to ASTM F2200 for Exception.

3.1.4 Positive stops shall be required to limit travel to the designed fully open and fully closed positions. These stops shall be installed at either the top of the gate, or at the bottom of the gate where such stops shall horizontally or vertically project no more than is required to perform their intended function.

3.1.5 All gates shall be designed with sufficient lateral stability to assure that the gate will enter a receiver guide, refer to ASTM F2200 for panel types.

3.2 The following provisions shall apply to Class IV vehicular horizontal slide gates:

3.2.1 All weight bearing exposed rollers 8 feet (2.44 m), or less, above grade shall be guarded or covered.

3.2.2 Positive stops shall be required to limit travel to the designed fully open and fully closed positions. These stops shall be installed at either the top of the gate, or at the bottom of the gate where such stops shall horizontally or vertically project no more than is required to perform their intended function.

4. VEHICULAR HORIZONTAL SWING GATES

4.1 The following provisions shall apply to Class I, Class II and Class III vehicular horizontal swing gates:

4.1.1 Gates shall be designed, constructed and installed so as not to create an entrapment area between the gate and the supporting structure or other fixed object when the gate moves toward the fully open position, subject to the provisions in 4.1.1.1 and 4.1.1.2.

4.1.1.1 The width of an object (such as a wall, pillar or column) covered by a swing gate when in the open position shall not exceed 4 inches (102 mm), measured from the center line of the pivot point of the gate, refer to ASTM F2200 for exception.

4.1.1.2 Except for the zone specified in Section 4.1.1.1, the distance between a fixed object such as a wall, pillar or column, and a swing gate when in the open position shall not be less than 16 inches (406 mm), refer to ASTM F2200 for exception.

4.2 Class IV vehicular horizontal swing gates shall be designed, constructed and installed in accordance with security related parameters specific to the application in question.
INTRODUCTION

CARTON INVENTORY

NOT SHOWN: Documentation Packet, Chain #50 - 24 feet, Eye Bolt Kit

TOOLS NEEDED

- 3/4" wrench for 1/2" concrete anchors
- Screwdrivers (Phillips head and flat head)
- Cable cutters and strippers
**OPERATOR SPECIFICATIONS**

This model is intended for use in vehicular slide gate applications:

<table>
<thead>
<tr>
<th>Usage Classification</th>
<th>Class I, II, III, and IV</th>
</tr>
</thead>
</table>
| Accessory Power      | **Main Control Board:** 24 Vac, 500 mA max.  
**Terminal Strip:** 24 Vac, 2.2 A max. for 120/208-240 Vac, Single Phase and 208-240/480 Vac Three Phase  
24 Vac, 1.3 A max. for 575 Vac, Three Phase |
| Maximum Gate Weight  | **1/2 HP (1 Phase and 3 Phase):** 1000 lbs.  
**1 HP (1 Phase and 3 Phase):** 1600 lbs.  
**1-1/2 HP (1 Phase):** 1900 lbs. |
| Minimum Gate Travel Distance | 4 feet (1.2 m) |
| Maximum Gate Travel Distance | **1/2 HP (1 Phase and 3 Phase):** Cantilever: 25 feet  
OH Roller: 45 feet  
V-Track: 35 feet  
1 HP (1 Phase and 3 Phase): Cantilever: 35 feet  
OH Roller: 70 feet  
V-Track: 50 feet  
1-1/2 HP (1 Phase): Cantilever: 40 feet  
OH Roller: 75 feet  
V-Track: 55 feet |
| Maximum Gate Travel Speed | 1 foot/second |
| Maximum Daily Cycle Rate | Continuous |
| Maximum Duty Cycle | Continuous |
| Operating Temperature | Without Heater: -20°C to 60°C (-4°F to 140°F)  
With Optional Heater: -40°C to 60°C (-40°F to 140°F) |
| Expansion Board | Provided |
| Inherent Entrapment Protection (Type A) | RPM |
| External Entrapment Protection (Type B1 and/or Type B2) | 3 inputs per board - any combination of up to 3 photoelectric sensors and up to 2 edge sensors |

</table>

Accessory Outlets are rated for 120 Vac, 6 Amps maximum. **NOTE:** The outlet is only available on models with 120 Vac input. The 120 Vac outlet is automatically disabled when the operator is configured for any voltage other then 120 Vac.

For 240 Vac multiply length by 2
For 480 Vac multiply length by 4
For 575 Vac multiply length by 4.8

**NOTE:** Chart is based on 5% voltage drop
SITE PREPARATION

Check the national and local building codes **BEFORE** installation.

### CONDUIT & CONCRETE PAD

Conduit must be UL approved for low and high voltage. Consider the operator placement **BEFORE** installing the pad or post.

### GATE

Gate must be constructed and installed according to ASTM F2200 standards (refer to page 5). Gate must fit specifications of operator (refer to specifications).

### SAFETY CATCH ROLLERS

Install catch rollers with safety covers on the side of a post or wall with a minimal distance of half an inch between the rollers and gate.

**DO NOT** use a gate catch post. Because the coasting distance may vary due to changes in temperature, it is **NOT** recommended to install a catch post in front of the gate's path. To do so will cause the gate to hit the post in certain instances.

### VEHICLE LOOPS

The vehicle loops allow the gate to stay open when vehicles are obstructing the gate path. Suggested for vehicles 14 feet (4.27 m) or longer. Vehicle loops are not required but are recommended.

### SAFETY

Entrapment protection devices are required to protect against any entrapment or safety conditions encountered in your gate application. Install warning signs on both sides of the gate.

Warning Signs

Entrapment Zone

Concrete Pads

(Inside Property)
OVERVIEW OF TYPICAL INSTALLATION

IMPORTANT SAFETY INFORMATION: One or more external monitored entrapment protection sensors shall be located where the risk of entrapment or obstruction exists at either the opening or closing direction. Any gap larger than 2-1/4 inches between the gate and a fixed object such as a wall, pillar, column, or operator must be filled.

SINGLE GATE

DUAL GATE

NOTE: Power and control wiring MUST be run in separate conduits.
**INSTALLATION**

**CAUTION**

- To AVOID damaging gas, power or other underground utility lines, contact underground utility locating companies BEFORE digging more than 18 inches (46 cm) deep.
- DO NOT touch the heater when switch is on, heater may be hot.
- To prevent damage to the operator or gate, DO NOT drive the limit (nuts) actuators on the shaft past their normal positions.

**TYPES OF INSTALLATIONS**

**PAD MOUNT INSTALLATION**

**POST MOUNT INSTALLATION**
STEP 1

INSTALL THE OPERATOR

Check the national and local building codes before installation.

PAD MOUNT INSTALLATION

RETRO-FIT INSTALLATION

The operator is shipped from the factory with the lower mounting angles configured out (Figure 1). If you have pad constrictions, either angle can be unbolted and reversed to angle in. **NOTE:** If you are replacing an SL580 and wish to use the same pad mounting hardware, the gate side mounting angle must be installed angle in.

NEW INSTALLATION

1. Lay out concrete pad.
2. Install the electrical conduit.
3. Pour a concrete pad (reinforced concrete is recommended).
4. Secure operator to the concrete pad using four 1/2" concrete anchors (not provided).
STEP 1 (continued)

INSTALL THE OPERATOR

Check the national and local building codes before installation.

POST MOUNT INSTALLATION

RETRO-FIT INSTALLATION

The operators come from the factory configured to mount to an inside the frame post mount dimension of 26" (66 cm) (outside to outside of posts). The frame comes slotted to accommodate posts 24-1/8" (61 cm) to 26" (66 cm), outside to outside. **NOTE:** If you are replacing a SL580, the frame will require adjustment to 24-1/8".

NEW INSTALLATION

1. Locate and anchor two posts made of 3" (7.6 cm) outer diameter heavy walled pipe. Posts should be parallel and square to the gate.
2. Locate electrical conduit, as required, prior to pouring concrete.
3. Secure operator to posts using four 3" (7.6 cm) U-bolts and hardware provided.
STEP 2

ATTACH THE CHAIN

DO NOT run the operator until instructed.

1. Mount gate brackets to the vertical front and rear posts of the gate.
2. Remove the operator cover.
3. Locate and engage the manual release handle and lock it in place.
4. Connect the chain to the rear bracket with the provided hardware.
5. Ensure that the drive and idler sprockets are in line with each other. Thread the chain through the plastic chain guide, around drive and idler sprockets, and then through the second plastic chain guide toward front gate bracket.
6. Adjust the chain to proper length and connect the chain to the front bracket with the provided hardware. Adjust nuts on chain take-up bolts to remove chain slack. A general rule of thumb is to leave a maximum of 1’ (2.5 cm) of chain slack for every 10’ (3.1 m) of chain length. Do not overtighten chain.
7. Remove the pin from the vent plug on the gear box.

NOTE ABOUT SOME TYPES OF CANTILEVER GATES:
With some cantilever gates over 20’ (6.1 m) long, you may need to add a brace along the length of the gate to prevent the gate from bowing when chain is tightened. This may also be required on some styles of gates that are constructed out of aluminum. If positioned properly, this brace can also be used as a chain support.
## INSTALLATION

### WARNING

To prevent SERIOUS INJURY or DEATH from a moving gate:

- ALL gate operator systems REQUIRE two independent entrapment protection systems for each entrapment zone.
- Entrapment protection devices MUST be installed to protect anyone who may come near a moving gate.
- Locate entrapment protection devices to protect in BOTH the open and close gate cycles.
- Locate entrapment protection devices to protect between moving gate and RIGID objects, such as posts, walls, pillars, or columns.

### STEP 3

## INSTALL ENTRAPMENT PROTECTION

This operator contains an inherent (internal) entrapment protection system and REQUIRES the addition of an external monitored entrapment protection system (non-contact photoelectric sensor or contact edge sensor) for EACH entrapment zone prior to gate movement. A monitored device sends a pulsed signal to the operator so the operator is aware of the device. If the operator does not receive the signal from the device it will not run.

An entrapment zone is every location or point of contact where a person can become entrapped between a moving gate and a stationary object. Your application may contain one or many entrapment zones. Property owners are obligated to test entrapment protection devices monthly. **Use only LiftMaster approved entrapment protection devices (refer to the accessory page).**

### NON-CONTACT SENSORS

If the photoelectric sensor beam gets blocked while the gate is moving, the gate will stop and reverse. The gate will not be able to travel in that direction until the obstruction is cleared. Monitored photoelectric sensors MUST be used. If a monitored photoelectric sensor is not working or loses power or the beam is blocked, then ALL gate operation in that direction will stop.

### CONTACT SENSORS (EDGE SENSORS)

If the electrically activated edge sensor comes in contact with an obstruction while the gate is moving, the gate will stop and reverse. The gate will not be able to travel in that direction until the obstruction is cleared.
STEP 3 continued...

INSTALL ENTRAPMENT PROTECTION

There are three options for wiring the entrapment protection devices depending on the specific device and how the device will function. Refer to the specific entrapment protection device manual for more information. These entrapment protection device inputs are for monitored devices, which include pulsed photoelectric sensors, resistive edge sensors, and pulsed edge sensors. Only one monitored entrapment protection device may be wired to each input. Additional entrapment protection devices may be wired to the expansion board.

CONTROL BOARD

CLOSE EYES/INTERRUPT (2 Terminals)
The CLOSE EYES/INTERRUPT input is for photoelectric sensor entrapment protection for the close direction. When an obstruction is sensed during gate closing the gate will open to the full open position and resets the Timer-to-Close. This input will be disregarded during gate opening.

CLOSE EDGE (2 Terminals)
The CLOSE EDGE input is for edge sensor entrapment protection for the close direction. When an obstruction is sensed during gate closing the gate will reverse to the full open position, disengaging the Timer-to-Close. This input will be disregarded during gate opening.

OPEN EYES/EDGE (2 Terminals)
The OPEN EYES/EDGE input is for photoelectric sensor or edge sensor entrapment protection for the open direction. When an obstruction is sensed during gate opening the gate will reverse for 4 seconds then stop. This input will be disregarded during gate closing.

EXPANSION BOARD

EYE ONLY and COM
Open or Close Direction Photoelectric Sensors, the functionality is based on the switch settings (located next to the terminals)

Switch set to CLOSE: gate reverses fully when an obstruction is sensed
Switch set to OPEN: gate reverses 4 seconds when an obstruction is sensed

EYE/EDGE and COM
Open or Close Direction Photoelectric Sensors or Edge Sensor, the functionality is based on the switch settings (located next to the terminals)

Switch set to CLOSE: gate reverses fully when an obstruction is sensed
Switch set to OPEN: gate reverses 4 seconds when an obstruction is sensed
**STEP 4**

**EARTH GROUND ROD**

Use the proper earth ground rod for your local area. The ground wire must be a single, whole piece of wire. Never splice two wires for the ground wire. If you should cut the ground wire too short, break it, or destroy its integrity, replace it with a single wire length.

1. Install the earth ground rod within 3 feet of the operator.
2. Run wire from the earth ground rod to the operator.

**NOTE:** If the operator is not grounded properly the range of the remote controls will be reduced and the operator will be more susceptible to lightning and surge damage.

**STEP 5**

**POWER WIRING**

⚠️ **WARNING**

To reduce the risk of SEVERE INJURY or DEATH:

- ANY maintenance to the operator or in the area near the operator MUST NOT be performed until disconnecting the electrical power (AC or solar and battery) and locking-out the power via the operator power switch. Upon completion of maintenance the area MUST be cleared and secured, at that time the unit may be returned to service.
- Disconnect power at the fuse box BEFORE proceeding. Operator MUST be properly grounded and connected in accordance with national and local electrical codes. **NOTE:** The operator should be on a separate fused line of adequate capacity.
- ALL electrical connections MUST be made by a qualified individual.
- DO NOT install ANY wiring or attempt to run the operator without consulting the wiring diagram.
- ALL power wiring should be on a dedicated circuit and well protected. The location of the power disconnect should be visible and clearly labeled.
- ALL power and control wiring MUST be run in separate conduit.

For dual gate applications, power will have to be connected to each operator. Main power supply and control wiring MUST be run in separate conduits.
STEP 5 (continued)

POWER WIRING

SINGLE PHASE

The operator is field configurable for usage at 120, 208, and 240 Vac. Factory default is 120 Vac.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>For 208 Vac Operation</td>
<td>Unplug the motor harness from the “120V” receptacle on the power board and plug the harness in to the “208V / 240V” receptacle. Swap the orange and red transformer wires (the red wire connects to the 240V position and the orange wire connects to the 208V position).</td>
</tr>
<tr>
<td>For 480 Vac Operation</td>
<td>Unplug the motor harness from the “120V” receptacle on the power board and plug the harness into the “208V / 240V” receptacle.</td>
</tr>
</tbody>
</table>

1. Make sure the AC power switch on the operator is OFF (the AC power switch will turn the incoming power ON or OFF).
2. Turn off the AC power from the main power source circuit breaker.
3. Run the AC power wires to the junction box on the operator.
4. Remove the junction box cover.
5. Connect the operator wires to line power via the white, black, and green wires in the junction box. Follow the table in the specification section for the appropriate wire gauge for your application.
6. Replace the junction box cover. Ensure the wires are not pinched.
7. Turn on the AC power from the main power source circuit breaker.
8. Turn on the AC power switch.

NOTES:
The 120 Vac accessory power outlets are not switched and will be live when 120 Vac incoming power is supplied to the operator regardless of whether the AC power switch is on or off.
The 120 Vac accessory power outlets are automatically disabled when the operator is configured for 208V or 240V operation.
STEP 5 (continued)

POWER WIRING

THREE PHASE

The operator is field configurable for usage at 208, 240, and 480 Vac. Factory default is 240 Vac. For three phase 575V operators, the operator is configured at the factory for 575V ONLY.

<table>
<thead>
<tr>
<th>For 208 Vac Operation</th>
<th>Ensure the motor harness is plugged in to the “208V / 240V” receptacle on the power board. Swap the orange and red transformer wires (the red wire connects to the 240V position and the orange wire connects to the 208V position).</th>
</tr>
</thead>
<tbody>
<tr>
<td>For 480 Vac Operation</td>
<td>Unplug the motor harness from the “208V / 240V” receptacle on the power board and plug the harness into the “480V” receptacle.</td>
</tr>
</tbody>
</table>

1. Make sure the AC power switch on the operator is OFF (the AC power switch will turn the incoming power ON or OFF).
2. Turn off the AC power from the main power source circuit breaker.
3. Run the AC power wires to the junction box on the operator.
4. Remove the junction box cover.
5. Connect the operator wires to line power via the white, black, purple and green wires in the junction box. Follow the table in the specification section for the appropriate wire gauge for your application.
6. Replace the junction box cover. Ensure the wires are not pinched.
7. Turn on the AC power from the main power source circuit breaker.
8. Turn on the AC power switch.

NOTE: To use a heater with the 480V configuration an additional step down transformer is required.
STEP 6

DUAL GATES ONLY

There are two options for dual gate communication: wired or wireless. Follow the directions according to your application. Do not use wired and wireless communication simultaneously.

WIRELESS DUAL GATES

TO ACTIVATE THE WIRELESS FEATURE:
1. Choose an operator to be the network primary operator. All wireless accessories will need to be programmed to the primary operator. **NOTE:** We recommend that all accessories and board configurations are set on the primary operator.
2. Press and release the LEARN button on the primary operator. The green XMITTER LED will light. **NOTE:** The operator will time out of programming mode after 180 seconds.
3. Press and release the LEARN button again on the primary operator. The yellow NETWORK LED will light.
4. Press and release the OPEN test button to assign this operator as network primary.
5. Press and release the LEARN button on the second operator. The green XMITTER LED will light.
6. Press and release the LEARN button again on the second operator. The yellow NETWORK LED will light.
7. Press and release the CLOSE test button to assign this operator as network second.
Both operators will beep and the yellow NETWORK LEDs will turn off indicating programming is successful.

TO DEACTIVATE THE WIRELESS FEATURE:
1. Press and release the LEARN button on either operator. The green XMITTER LED will light.
2. Press and release the LEARN button again on the same operator. The yellow NETWORK LED will light.
3. Press and hold the LEARN button for 5 seconds. The yellow NETWORK LED will blink (operator will beep) then turn off indicating successful deactivation.

Repeat the steps for the other operator.
STEP 6 continued...

DUAL GATES ONLY

**WIRED DUAL GATES**

Before digging, contact local underground utility locating companies. Use PVC conduit to prevent damage to cables.

1. **Disconnect ALL power to the operator.**
2. Trench across driveway to bury the shielded twisted pair cable.
3. Connect the wires from the shielded twisted pair cable to the Com Link terminals on the primary gate operator control board. **NOTE:** We recommend that all accessories and board configurations are set on the primary operator.
4. Route the shielded twisted pair cable to the secondary gate operator’s control board.
5. Connect the wires from the shielded twisted pair cable to the Com Link terminals on the secondary control board (Com Link A to Com Link A and Com Link B to Com Link B). Ground the shield of the cable to the chassis ground of one operator.
6. **Connect ALL power to the operator.**
STEP 7

ADJUST THE HANDING AND LIMITS

The adjustments allow you to set where the gate will stop in the open and close position. The force is adjusted automatically when you set the limits but should be fine tuned using the FORCE dial on the control board (refer to Force Dial section). The Test Buttons on the control board will not work until the handing is set. For dual gate applications the limits will have to be set for each operator. The gate MUST be attached to the operator before setting the limits and force.

OPEN RIGHT: If the operator is installed on the right side of the driveway when looking out of the property, the gate should be set to open right.

OPEN LEFT: If the operator is mounted on the left side of the driveway when looking out of the property, the gate should be set to open left.

SET THE HANDING

1. To set the initial handing of the operator, make sure that both OPEN LEFT and OPEN RIGHT LEDs are flashing. If they are not flashing, press and hold both the OPEN LEFT and OPEN RIGHT handing buttons until both handing LEDs start to flash and the operator beeps.

2. Press and release either the OPEN RIGHT or OPEN LEFT button depending on which direction the gate should open. The corresponding handing LED will turn solid.

SET THE LIMITS

1. Make sure the gate is closed.

2. Press and release the OPEN test button to open the gate.

3. Press the STOP test button when the desired OPEN limit is reached. Adjust the limit nut or cam so it makes contact with the OPEN limit switch at this position. If the gate stops early, move the limit nut or cam to allow for additional travel.

4. Press and release the CLOSE test button to close the gate.

5. Press the STOP test button when the desired CLOSE limit is reached. Adjust the limit nut or cam so it makes contact with the CLOSE limit switch at this position. If the gates stops early, move the limit nut to allow for additional travel.

SET THE FORCE AND RUN DISTANCE

1. Press the OPEN test button to open the gate.

2. Press and release both the OPEN LEFT and OPEN RIGHT handing buttons.

3. Press the handing button below the solid LED.

4. Run the operator one full cycle using the test buttons. The initial forces and run distance will be set during this cycle.

READJUST THE LIMITS

To readjust the limits, follow the “Set the Limits” and “Set the Force and Run Distance” instructions above. It is important that the force and run distance are set after every limit readjustment.
STEP 7 (continued)

ADJUST THE HANDING AND LIMITS

ERASE THE HANDING

1. To erase the handing, press and hold the OPEN LEFT and OPEN RIGHT buttons simultaneously (5 seconds) until both the OPEN LEFT and OPEN RIGHT LEDs blink rapidly and the operator beeps.

2. Release the buttons and the OPEN LEFT and OPEN RIGHT LEDs will blink slowly indicating the handing will need to be set.

<table>
<thead>

<td>ON</td>
<td>NORMAL MODE</td>
<td>Open right handing is set.</td>
<td></td>
</tr>
</tbody>
</table>

STEP 8

ADJUST THE CLUTCH

The friction clutch system is not an automatic obstruction sensing device. It only serves to minimize damage to the gate operator and gate, and to help minimize vehicle damage. The clutch mechanism must be adjusted properly. During the installation of the operator, you must tighten the clutch spring lock nut so it is tight enough to operate the gate, yet loose enough so that if the gate meets an obstruction, the clutch will slip.

1. Loosen set screws of torque adjustment nut on the gear reducer output shaft.

2. Back off torque nut until there is very little tension on the Belleville washers.

3. Tighten torque nut gradually until there is just enough tension to permit the operator to move the gate smoothly through a complete open/close cycle, but to allow the clutch to slip if the gate is obstructed.

4. Re-tighten the set screw that is directly over the flat portion of the shaft.
STEP 9

OBSTRUCTION TEST

The operator is equipped with an automatic obstruction sensing feature. If the gate encounters an obstruction during motion, the operator will automatically reverse direction of the gate for a short time and then stop the gate. After any adjustments are made, test the operator:

1. Open and close the gate with the TEST BUTTONS, ensuring that the gate is stopping at the proper open and close limit positions.
2. Place a solid object between the open gate and a rigid structure. Ensure that the gate, the solid object, and the rigid structure can withstand the forces generated during this obstruction test.
3. Run the gate in the close direction. The gate should stop and reverse upon contact with the solid object. If the gate does not reverse off the solid object, reduce the force setting by turning the force control slightly counter-clockwise. The gate should have enough force to reach both the open and close limits, but MUST reverse after contact with a solid object.
4. Repeat the test for the open direction.
**OPERATOR OVERVIEW**

- **Manual Release Handle**: Pull the manual release handle to manually open and close the gate.

- **Junction Box**: For additional accessory wiring.

- **Expansion Board**: Pages 31-34

- **Terminal Block**: For additional accessory wiring. Page 35

- **Operator Alarm**: Page 44

- **Operator Alarm Cover**: Page 44

- **AC Power Switch with Lockout Cover**: The AC power switch on the operator will turn the incoming power ON or OFF.

- **Reset Button**:
  - Press the reset button to stop a moving gate during a normal open/close cycle, like a stop button.
  - Press the reset button once while the gate is in open position to disable the Timer-to-Close. The gate will stay in the open position. To restart the Timer-to-Close either press the reset button or activate the gate with a programmed remote control.
  - Press the reset button to shut off the alarm and reset the operator.

- **Accessory Power Outlet**: (For 120 Vac, Single Phase Only)

- **Limit Switches**: Page 22

- **Control Board**: Pages 26-30

- **Power Board**:

- **Optional Locks**: Location for additional locks (not provided).

**NOTE**: The heater can only be turned off from the thermostat next to the heater.
CONTROL BOARD OVERVIEW

LEARN BUTTON

The LEARN button is used for programming (refer to Programming).

DIAGNOSTIC DISPLAY

The diagnostic display will show the operator type, firmware version, and codes. The operator type will display as “SL” followed by a “58” which indicates the operator type as SL585. The firmware version will show after the operator type, example “1.2”. For more information about the codes refer to the Troubleshooting section.

HANDING BUTTONS

The handing buttons are used to determine which direction the gate will open and they are also used to set the limits (refer to the Adjustment section).

- OPEN RIGHT: If the operator is installed on the right side of the drive when looking out of the property, a swing gate will swing to the right (turn counter clockwise) when opening and a slide gate will slide to the right when opening.
- OPEN LEFT: If the operator is mounted on the left side of the drive when looking out of the property, a swing gate will swing to the left (turn clockwise) when opening and a slide gate will slide to the left when opening.

**NOTE:** For gates installed on the outside of the property, the setting will be opposite. Determine the direction by looking towards the property from the outside.

BIPART DELAY

Used in dual gate applications where a maglock, solenoid lock, or decorative overlay would require one gate to close before the other. The BIPART DELAY is also used in applications where one gate travels a longer distance than the other.

- ON/OFF: The operator with the BIPART DELAY dial ON will delay from the close limit when opening and be the first to close from the open limit.
- BOTH OFF: No affect.
- BOTH ON: No affect.

TIMER-TO-CLOSE (TTC)

The TTC is factory set to OFF (0). Rotate the TIMER-TO-CLOSE dial to the desired setting (0 to 180 seconds). Any radio command, single button control, or CLOSE command on the control board prior to the TTC expiring will close the gate. The TTC is reset by any signals from the open controls, loops, close edges, and close photoelectric sensors.

- 0 seconds (OFF): The gate will remain open until the operator receives another command from a control.
- 1-180 seconds (ON): The gate will automatically close after the specified time period.
The force setting should be high enough that the gate will not reverse by itself nor cause nuisance interruptions, but low enough to prevent serious injury to a person. The force setting is the same for both the open and close gate directions.

**Settings 1-3:** Fixed force settings (the force will not adjust due to gate wear or temperature changes)

**Settings 4-10:** Automatically increase the force due to gate wear or temperature changes

**ADJUST THE FORCE**

1. Open and close the gate with the TEST BUTTONS, ensuring that the gate is stopping at the proper open and close limit positions. If the gate is not stopping at the proper limits, adjust the force dial accordingly.

2. Place a solid object between the open gate and a rigid structure. Ensure that the gate, the solid object, and the rigid structure can withstand the forces generated during this obstruction test.

3. Run the gate in the close direction. The gate should stop and reverse upon contact with the solid object. If the gate does not reverse off the solid object, reduce the force setting by turning the force control slightly counter-clockwise. The gate should have enough force to reach both the open and close limits, but MUST reverse after contact with a solid object.

4. Repeat the test for the open direction.

Repeat the test after every force adjustment.

**TEST BUTTONS**

*Used to operate the gate (OPEN, STOP and CLOSE). Also used to view the code history (refer to the Troubleshooting section).*

<tr>
<th>TERMINALS</th>
<th>FUNCTION</th>
<th>WIRING EXAMPLE</th>
</tr>
</thead>
<tbody>
<tr>
<td>FIRE DEPT (-) and OPEN (+)</td>
<td>FIRE DEPT and OPEN terminals act as a hard open. Maintained input overrides (ignores) external safeties (photoelectric sensor and edge), pauses Timer-to-Close. Momentary input logic as single button control and safeties remain active, re-enables Timer-to-Close.</td>
<td><img src="image" alt="Wiring Diagram" /></td>
</tr>
</tbody>
</table>

### LOOPS

The Loop terminals are used for connecting loops and various control devices such as telephone entry keypads, vehicle probes, etc. Connect the accessory to the terminals based on how the accessory should function.

<table>
<thead>
<tr>
<th>TERMINALS</th>
<th>FUNCTION</th>
<th>WIRING EXAMPLE</th>
</tr>
</thead>
</table>
| EXIT and COM | This input is a soft open command (maintained switch does not override external safeties and does not reset alarm condition). Used for exit probe, telephone entry, external exit loop detector, or any device that would command the gate to open.  
  • Opens a closing gate and holds open an open gate, if maintained, pauses Timer-to-Close at OPEN limit. | ![Wiring Diagram](image) |
| SHADOW and COM | This input is used for external shadow loop detector when loop is positioned under the swing of the gate.  
  • Holds open gate at open limit  
  • Only active when the gate is at the OPEN limit, disregarded at all other times  
  • Pauses Timer-to-Close at OPEN limit |  |
| INTERRUPT and COM | This input is used for photoelectric sensors and external interrupt loop detector when loop is on the outside of the gate.  
  • Holds open gate at open limit  
  • Stops and reverses a closing gate to open limit  
  • Pauses Timer-to-Close at OPEN limit, activates quick close and anti-tailgate features when enabled on the expansion board |  |
**WIRE ACCESSORIES TO CONTROL BOARD**

### PHOTOELECTRIC SENSORS AND EDGE SENSORS

The EYES/EDGE terminals are used for connecting entrapment protection devices. **At least one external monitored entrapment protection device is required prior to gate movement.** Monitored entrapment protection devices should have been installed with the operator at the time of installation. Only ONE monitored device may be connected to each input. A monitored device sends a pulsed signal to the operator so the operator is aware of the device. If the operator does not receive the signal from the device indicating it is working properly, it will not run in that direction.

<table>

<tr>
<td></td>
<td>motor activation and during motor run. Relay is off when motor is off.</td>
<td></td>
</tr>
</tbody>
</table>
**CAUTION**

To AVOID damaging the circuit board, relays or accessories, DO NOT connect more than 42 Vdc (32 Vac) to the AUX relay contact terminal blocks.

---

**EXIT FAIL SWITCH**

- **OPEN**: If the EXIT plug-in loop detector (model LOOPDETLM) detects a fault, then the gate will open and remain open until fault is cleared.
- **CLOSE**: If the EXIT plug-in loop detector (model LOOPDETLM) detects a fault, faults are ignored (EXIT loop is faulted and inoperative).

**AC FAIL SWITCH**

- **NOT USED**

**ANTI TAIL SWITCH**

- **OFF**: When CLOSE EYES/Interrupt loop is activated it causes a closing gate to stop and reverse.
- **ON**: When CLOSE EYES/Interrupt loop is activated it causes a closing gate to pause. Once the vehicle is clear the gate will continue to close.

**QUICK CLOSE SWITCH**

- **OFF**: No change to the gate’s normal operation.
- **ON**: When CLOSE EYES/Interrupt loop is deactivated it causes an opening or a stopped gate to close (ignores the Timer-to-Close).
EXPANSION BOARD OVERVIEW

AUXILIARY RELAY 1 AND 2

Normally Open (N.O.) and Normally Closed (N.C.) relay contacts to control external devices, for connection of Class 2, low voltage (42 Vdc [34 Vac] max 5 Amps) power sources only. Function of relay contact activation determined by switch settings.

<table>

<td>Cycle Quantity Feedback*</td>
<td>ON ON ON</td>
<td>The 1, 2, and 3 LEDs will blink out the cycle count (cycle count is stored on the control board). See below.</td>
<td></td>
</tr>
</tbody>
</table>

**CYCLE COUNT**

* First, note the current Aux Relay switch positions. To determine the actual cycles that the gate operator has run (in thousands), set all three Aux Relay switches to the ON setting for Aux Relay 1. The Expansion Board’s 1, 2, and 3 LEDs will blink out the cycle count, with 1 LED blinking 1,000’s, 2 LED blinking 10,000’s, 3 LED blinking 100,000’s, and simultaneously all three LED’s blink 1,000,000’s (e.g. 1 LED blinks 3 times, 2 LED blinks 6 times, and 3 LED blinks once. Cycle count is 163,000.). Cycle count displayed is between 1,000 and 9,999,000 cycles. After servicing, set Aux Relay switches back to their appropriate positions. Cycle count cannot be reset or changed. If under 1,000 cycles the 1, 2, and 3 LEDs will turn on for 10 seconds, then turn off.

**NOTE:** The expansion board will flash the cycle count 3 times then all the LEDs will turn on solid for 10 seconds then turn off.

**AUXILIARY RELAY WIRING EXAMPLE**

**RED/GREEN LIGHT FUNCTIONALITY**

Red light wired to AUX RELAY 1. Green light wired to AUX RELAY 2.

* For red light ON when gate is closed, set switch 1 on AUX RELAY 1 to ON.
### PHOTOELECTRIC SENSORS AND EDGE SENSORS

The EYES/EDGE terminals are used for connecting entrapment protection devices. **At least one external monitored entrapment protection device is required prior to gate movement.** Monitored entrapment protection devices should have been installed with the operator at the time of installation. Only ONE monitored device may be connected to each input. A monitored device sends a pulsed signal to the operator so the operator is aware of the device. If the operator does not receive the signal from the device indicating it is working properly, it will not run in that direction.

  - Holds open gate at open limit  
  - Stops and reverses a closing gate  
  - Pauses Timer-to-Close at Open Limit | ![Wiring Diagram] |

### ADDITIONAL WIRING

**SAMS WIRING WITH RELAYS NOT ENERGIZED**

![Diagram of Wiring Connections]
**WARNING**

To protect against fire and electrocution:
- DISCONNECT power (AC or solar and battery) BEFORE installing or servicing operator.

For continued protection against fire:
- Replace ONLY with fuse of same type and rating.

**NOTE:** These switches control how the Auxiliary Relays will function.
A total of 50 Security+ 2.0™ remote controls and 2 keyless entries (1 PIN for each keyless entry) can be programmed to the operator. When programming a third keyless entry to the operator, the first keyless entry will be erased to allow the third keyless entry to be programmed. When the operator’s memory is full it will exit the programming mode and the remote control will not be programmed. The memory will need to be erased before programming any additional remote controls. **NOTE**: If installing an 86LM to extend the range of the remote controls DO NOT straighten the antenna.

There are 3 different options for programming the remote control depending on how you would like the remote control to function. Choose a programming option:

<table>
<thead>
<tr>
<th>OPTION</th>
<th>DESCRIPTION</th>
<th>PROGRAMMING STEPS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single button as OPEN</td>
<td>Program a single button on the remote control for open only. The</td>
<td>1. Press and release the LEARN button (operator will beep and green XMITTER LED will light). <strong>NOTE</strong>: The operator will time out of programming mode after 30 seconds.</td>
</tr>
<tr>
<td>only</td>
<td>remote control can be set to close the gate.</td>
<td>2. Press the OPEN button.</td>
</tr>
<tr>
<td>Single button (SBC) as</td>
<td>Program one remote control button as an open, close, and stop.</td>
<td>3. Press the remote control button that you would like to program.</td>
</tr>
<tr>
<td>OPEN, CLOSE, and STOP</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Three separate buttons</td>
<td>Program each remote control button as an open, close, and stop.</td>
<td>1. Press and release the LEARN button (operator will beep and green XMITTER LED will light). <strong>NOTE</strong>: The operator will time out of programming mode after 30 seconds.</td>
</tr>
<tr>
<td>as OPEN, CLOSE, and STOP</td>
<td></td>
<td>2. Press the OPEN, CLOSE, or STOP button, depending on the desired function.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>3. Press the remote control button that you would like to program.</td>
</tr>
</tbody>
</table>

The operator will automatically exit learn mode (operator will beep and green XMITTER LED will go out) if programming is successful. To program additional Security+ 2.0™ remote controls or remote control buttons, repeat the programming steps above.

**NOTICE**: This device complies with part 15 of the FCC rules and Industry Canada (IC) licence-exempt RSS standard(s). Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Any changes or modifications not expressly approved by the party responsible for compliance could void the user’s authority to operate the equipment.

This Class B digital apparatus complies with Canadian ICES-003.

This device must be installed in a way where a minimum 8” (20 cm) distance is maintained between users/bystanders and device.

This device has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.
To program the operator to the LiftMaster Internet Gateway:

<table>
<thead>
<tr>
<th>Program using the learn button on the operator's control board:</th>
<th>Program using the reset button on the operator:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Connect the ethernet cable to the LiftMaster Internet Gateway and the router.</td>
<td>1. Connect the ethernet cable to the LiftMaster Internet Gateway and the router.</td>
</tr>
<tr>
<td>2. Connect power to the LiftMaster Internet Gateway.</td>
<td>2. Connect power to the LiftMaster Internet Gateway.</td>
</tr>
<tr>
<td>4. Register the LiftMaster Internet Gateway.</td>
<td>4. Register the LiftMaster Internet Gateway.</td>
</tr>
<tr>
<td>5. Use an internet enabled computer or smartphone to add devices. The LiftMaster Internet Gateway will stay in learn mode for three minutes.</td>
<td>5. Use an internet enabled computer or smartphone to add devices. The LiftMaster Internet Gateway will stay in learn mode for three minutes.</td>
</tr>
<tr>
<td>6. Press the Learn button twice on the primary operator (the operator will beep as it enters learn mode). The LiftMaster Internet Gateway will pair to the operator if it is within range and the operator will beep if programming is successful.</td>
<td>6. Ensure gate is closed.</td>
</tr>
<tr>
<td>7. Give the operator an OPEN command.</td>
<td>8. Within 30 seconds, when the gate is at the open limit press and release the reset button 3 times (on primary gate) to put primary operator into High Band Learn Mode (the operator will beep as it enters learn mode). The LiftMaster Internet Gateway will pair to the operator if it is within range and the operator will beep if programming is successful.</td>
</tr>
</tbody>
</table>

The status as shown by the LiftMaster Internet Gateway app will be either “open” or “closed”. The gate operator can then be controlled through the LiftMaster Internet Gateway app.

**ERASE ALL CODES**

1. Press and release the LEARN button (operator will beep and green XMITTER LED will light).
2. Press and hold the LEARN button again until the green XMITTER LED flashes and then release the button (approximately 6 seconds). All remote control codes are now erased.

**TO REMOVE AND ERASE ALL MONITORED ENTRAPMENT PROTECTION DEVICES**

1. Remove the entrapment protection device wires from the terminal block.
2. Press and release the OPEN LEFT and OPEN RIGHT buttons simultaneously. The handing direction LED will remain solid. The other direction LED will begin flashing (entering setup mode).
3. Press the OPEN LEFT and OPEN RIGHT buttons simultaneously to exit.
## GATE OPERATOR SETUP EXAMPLES

The following are example setups for the gate operator. Your specific site requirements may be different. Always setup the operator system to the site requirements, including all necessary entrapment protection devices.

**RESIDENTIAL:** One to four residential homes sharing a gated entrance/exit, allowing vehicle access trumps security concerns

**COMMERCIAL/GENERAL ACCESS:** A residential community (more than four homes) having one or more gated entrances/exits, allowing vehicle access trumps security concerns

**COMMERCIAL:** Business site where security (gate closed) is important

**INDUSTRIAL:** Large business site where security is required

MAINTENANCE

IMPORTANT SAFETY INFORMATION

⚠️ WARNING

To reduce the risk of SEVERE INJURY or DEATH:
- READ AND FOLLOW ALL INSTRUCTIONS.
- ANY maintenance to the operator or in the area near the operator MUST NOT be performed until disconnecting the electrical power (AC or solar and battery) and locking-out the power via the operator power switch. Upon completion of maintenance the area MUST be cleared and secured, at that time the unit may be returned to service.
- Disconnect power at the fuse box BEFORE proceeding. Operator MUST be properly grounded and connected in accordance with national and local electrical codes. NOTE: The operator should be on a separate fused line of adequate capacity.
- NEVER let children operate or play with gate controls. Keep the remote control away from children.
- ALWAYS keep people and objects away from the gate. NO ONE SHOULD CROSS THE PATH OF THE MOVING GATE.
- The entrance is for vehicles ONLY. Pedestrians MUST use separate entrance.

- Test the gate operator monthly. The gate MUST reverse on contact with a rigid object or reverse when an object activates the non-contact sensors. After adjusting the force or the limit of travel, retest the gate operator. Failure to adjust and retest the gate operator properly can increase the risk of INJURY or DEATH.
- Use the manual disconnect release ONLY when the gate is NOT moving.
- KEEP GATES PROPERLY MAINTAINED. Read the owner’s manual. Have a qualified service person make repairs to gate hardware.
- ALL maintenance MUST be performed by a LiftMaster professional.
- Activate gate ONLY when it can be seen clearly, is properly adjusted and there are no obstructions to gate travel.
- SAVE THESE INSTRUCTIONS.

⚠️ WARNING

To protect against fire and electrocution:
- DISCONNECT power (AC or solar and battery) BEFORE installing or servicing operator.

For continued protection against fire:
- Replace ONLY with fuse of same type and rating.

MAINTENANCE

Disconnect all power to the operator before servicing.

</tr>
</tbody>
</table>

NOTES:
- Severe or high cycle usage will require more frequent maintenance checks.
- Limits may have to be reset after any major drive chain adjustments.
- If lubricating chain, use only lithium spray. Never use grease or silicone spray.
- Over time, the drive chain on the operator will stretch and need to be tightened. To tighten the drive chain adjust either of the two chain eye bolts. The chain should have no more than 1 inch of sag for every 10 feet of chain length.
- It is suggested that while at the site voltage readings be taken at the operator. Using a digital voltmeter, verify that the incoming voltage to the operator is within ten percent of the operator’s rating.
To protect against fire and electrocution:
- DISCONNECT power (AC or solar and battery) BEFORE installing or servicing operator.

For continued protection against fire:
- Replace ONLY with fuse of same type and rating.

**DIAGNOSTIC CODES**

**TO VIEW THE CODES**

The codes will show on the diagnostic display.

The operator will show the code sequence number followed by the code number:

**CODE SEQUENCE NUMBER**
The first number shown is the most recent code (example: "01"). The display will show the sequence of codes that occurred starting with "01" and going up to code "20".

**CODE NUMBER**
The second number shown after the code sequence number is the code itself (31-99, example: "31"). Refer to the chart on the following page for an explanation of each code.

**TO SCROLL THROUGH THE SAVED CODES**

TO EXIT

Press and release the STOP button to exit. The display will also time out after two minutes of inactivity.

TO RESET THE CODE HISTORY

1. Press and hold the STOP button for six seconds. The display will show "Er" then "CL" alternately for six seconds.
2. Release the STOP button. The code history has now been reset and the display will show "- -" until a new code occurs.
3. Press and release the STOP button to exit.
## TROUBLESHOOTING

### DIAGNOSTIC CODES continued...

Some codes are saved in the code history and some are not. If a code is not saved it will briefly appear on the display as it occurs, then disappear.

<tr>
<td>96</td>
<td>Current Sensor Fault</td>
<td>A fault was detected on the current sensor. Make sure the current sensor is connected to the main control board. Check the current sensor harness for an open or short. The operator will need a power cycle to resume operation after correcting the fault. If the fault continues, replace the power board.</td>
<td>YES</td>
</tr>
<tr>
<td>99</td>
<td>Normal Operation</td>
<td>No action required</td>
<td>YES</td>
</tr>
</tbody>
</table>
OPERATOR ALARM

If a contact sensor detects an obstruction twice consecutively the alarm will sound (up to 5 minutes) and the operator will need to be reset. If a command is given after the initial 5 minutes the operator will beep.

When the inherent force of the operator (RPM/current sensor) detects the following (twice consecutively) the alarm will sound (up to 5 minutes) and the operator will need to be reset:

A. The gate is hitting a wall or vehicle.
B. The gate does not meet specifications.
C. Debris is on the gate’s track such as mud, rocks, dirt, etc.
D. The gate has one or more broken axles or wheels.
E. The gate wheel is off the gate rail.

Remove any obstructions. Press the reset button to shut off the alarm and reset the operator. After the operator is reset, normal functions will resume.
# Troubleshooting Chart

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Possible Causes</th>
<th>Solutions</th>
</tr>
</thead>
</table>
| Operator does not run and diagnostics display not on. | a) No power to control board  
b) Open fuse  
c) Defective control board | a) Check AC power  
b) Check fuses  
c) Replace defective control board |
| Control board powers up, but motor does not run. | a) Reset switch is stuck  
b) Stop button active or jumper not in place for stop circuit  
c) Open or Close input active  
d) Entrapment Protection Device active  
e) Vehicle loop detector or probe active  
f) Defective control board | a) Check reset switch  
b) Check Stop button is not “stuck on”, or verify that the stop button is a normally closed circuit, or put a jumper on the stop circuit.  
c) Check all Open and Close inputs for a “stuck on” input  
d) Check all Entrapment Protection Device inputs for a “stuck on” sensor  
e) Check all vehicle detector inputs for a “stuck on” detector  
f) Replace defective control board |
| Gate moves, but cannot set correct limits. | a) Gate does not move to a limit position  
b) Gate is too difficult to move  
c) Limits are set too close (slide gate applications only) | a) Use manual disconnect, manually move gate, and ensure gate moves easily limit to limit. Repair gate as needed.  
b) Gate must move easily and freely through its entire range, limit to limit. Repair gate as needed.  
c) Ensure the gate moves at least four feet between the OPEN limit and the CLOSE limit. |
| Gate does not fully open or fully close when setting limits. | a) Gate does not move to a limit position  
b) Gate is too difficult to move | a) Use manual disconnect, manually move gate, and ensure gate moves easily limit to limit. Repair gate as needed.  
b) Gate must move easily and freely through its entire range, limit to limit. Repair gate as needed. |
| Operator does not respond to a wired control/command (example: Open, Close, SBC, etc.) | a) Check Open and Close command input LEDs  
b) Stop button is active  
c) Reset button is stuck  
d) Entrapment Protection Device active  
e) Vehicle loop detector or probe active | a) Check all Open and Close inputs for a “stuck on” input  
b) Check Stop button is not “stuck on”  
c) Check Reset button  
d) Check all Entrapment Protection Device inputs for a “stuck on” sensor  
e) Check all vehicle detector inputs for a “stuck on” detector |
| Operator does not respond to a wireless control or transmitter | a) Check XMITTER LED when wireless control is active  
b) Stop button is active  
c) Reset button is stuck  
d) Poor radio reception | a) Activate wireless control and check XMITTER LED is on. Re-learn wireless control/transmitter to control board. Replace wireless control as needed.  
b) Check Stop button is not “stuck on”  
c) Check Reset button  
d) Check if similar wired control operates correctly. Check if wireless controls works properly when within a few feet of operator. Check operator’s antenna and antenna wire. Check other wireless controls or devices. |
| Gate stops during travel and reverses immediately. | a) Control (Open, Close) becoming active  
b) Vehicle loop detector active | a) Check all Open and Close inputs for an active input  
b) Check all vehicle detector inputs for an active detector |
| Gate opens, but will not close with transmitter or Timer-to-Close. | a) Open control active  
b) Vehicle loop detector active  
c) Fire Dept input active  
d) Timer-to-Close not set  
e) Close Entrapment Protection Device active | a) Check all Open inputs for an active input  
b) Check all vehicle detector inputs for an active detector  
c) Check Fire Dept input  
d) Check Timer-to-Close (TTC) setting  
e) Check all Entrapment Protection Device inputs for an active sensor |
| Gate closes, but will not open. | a) Vehicle loop detector active | a) Check all vehicle detector inputs for an active detector |
| Exit loop activation does not cause gate to open. | a) Exit vehicle detector setup incorrectly  
b) Defective Exit loop detector | a) Review Exit loop detector settings. Adjust settings as needed.  
b) Replace defective Exit loop detector. |
| Interrupt loop does not cause gate to stop and reverse. | a) Vehicle detector setup incorrectly  
b) Defective vehicle loop detector | a) Review Interrupt loop detector settings. Adjust settings as needed.  
b) Replace defective Interrupt loop detector. |
## TROUBLESHOOTING

### TROUBLESHOOTING CHART continued...

<table>
<thead>
<tr>
<th>SYMPTOM</th>
<th>POSSIBLE CAUSES</th>
<th>SOLUTIONS</th>
</tr>
</thead>
</table>
| Shadow loop does not keep gate at open limit.     | a) Vehicle detector setup incorrectly  
        b) Defective vehicle loop detector                                          | a) Review Shadow loop detector settings. Adjust settings as needed.  
        b) Replace defective Shadow loop detector.                                   |
| Obstruction in gate’s path does not cause gate to stop and reverse | a) Force adjustment needed                                                  | a) Refer to the Adjustment section to conduct the obstruction test and perform the proper force adjustment that is needed. |
| Photoelectric sensor does not stop or reverse gate.| a) Incorrect photoelectric sensor wiring  
        b) Defective photoelectric sensor  
        c) Photoelectric sensors installed too far apart                       | a) Check photoelectric sensor wiring. Retest that obstructing photoelectric sensor causes moving gate to stop, and may reverse direction.  
        b) Replace defective photoelectric sensor. Retest that obstructing photoelectric sensor causes moving gate to stop, and may reverse direction.  
        c) Move the photoelectric sensors closer together or use edge sensors instead. |
| Edge Sensor does not stop or reverse gate.        | a) Incorrect edge sensor wiring  
        b) Defective edge sensor                                                    | a) Check edge sensor wiring. Retest that activating edge sensor causes moving gate to stop and reverse direction.  
        b) Replace defective edge sensor. Retest that activating edge sensor causes moving gate to stop and reverse direction. |
| Alarm sounds for 5 minutes or alarm sounds with a command. | a) Double entrapment occurred (two obstructions within a single activation)  | a) Check for cause of entrapment (obstruction) detection and correct. Press the reset button to shut off alarm and reset the operator. |
| On dual-gate system, incorrect gate opens first or closes first. | a) Incorrect Bipart switch setting  | a) Change setting of both operator’s Bipart switch settings. One operator should have Bipart switch ON (operator that opens second) and the other operator should have Bipart switch OFF (operator that opens first) |
| Alarm beeps when running.                         | a) Expansion board setting  
        b) Constant pressure to open or close is given                            | a) Pre-warning is set to “ON”  
        b) Constant pressure to open or closed is given                            |
| Expansion board function not controlling gate.   | a) Defective main board to expansion board wiring  
        b) Incorrect input wiring to expansion board  
        c) Defective expansion board or defective main board | a) Check main board to expansion board wiring. If required, replace wire cable.  
        b) Check wiring to all inputs on expansion board.  
        c) Replace defective expansion board or defective main board |
| Maglock not working correctly.                   | a) Maglock wired incorrectly                                                   | a) Check that Maglock is wired to N.C. and COM terminals. Check that Maglock has power (do not power maglock from control board accessory power terminals). If shorting lock’s NO and COM wires does not activate Maglock, then replace Maglock or Maglock wiring (refer to Wiring Diagrams). |
| Solenoid lock not working correctly.             | a) Solenoid wired incorrectly                                                  | a) Check that Solenoid is wired to N.O. and COM terminals. Check that Solenoid has power (do not power solenoid from control board accessory power terminals). If shorting lock’s NC and COM wires does not activate Solenoid, then replace Solenoid lock or Solenoid wiring (refer to Wiring Diagrams). |
| Quick Close not working correctly.               | a) Quick Close setting incorrect  
        b) Interrupt loop detector  
        c) Defective Expansion board                                               | a) Check that Quick Close setting is ON  
        b) Check operation of Interrupt Loop detector  
        c) Replace defective Expansion board |
| Anti-Tailgating not working correctly.           | a) Anti-Tail setting incorrect  
        b) Interrupt loop detector  
        c) Defective Expansion board                                               | a) Check that Anti-Tail setting is ON  
        b) Check operation of Interrupt Loop detector  
        c) Replace defective Expansion board |
| AUX Relay not working correctly.                  | a) AUX Relay setting incorrect  
        b) AUX Relay wiring incorrect  
        c) Defective Expansion board                                               | a) Check AUX Relay switches settings  
        b) Check that wiring is connected to either N.O. and COM or to N.C. and COM.  
        c) Set AUX Relay to another setting and test. Replace defective expansion board. |

Model SLS585105U
- Motor: K94-37739-2
- Gear Reducer: K32-34792
- Clutch Kit: K75-34791
- Bearing Kit: K12-34846
- Brake Kit: K75-B1PH-1 (115 Volt Models), K75-B3PH (230/460 Volt Models), K75-B575 (575 Volt Models)

Model SLS585151U
- Motor: K94-37694-3
- Gear Reducer: K32-34792
- Clutch Kit: K75-34791
- Bearing Kit: K12-34846
- Brake Kit: K75-B1PH-1 (115 Volt Models), K75-B3PH (230/460 Volt Models), K75-B575 (575 Volt Models)
LIFTMASTER® TWO YEAR LIMITED WARRANTY

LiftMaster (“Seller”) warrants to the first purchaser of this product, for the structure in which this product is originally installed, that it is free from defect in materials and/or workmanship for a period of two years from the date of purchase. The proper operation of this product is dependent on your compliance with the instructions regarding installation, operation, maintenance and testing. Failure to comply strictly with those instructions will void this limited warranty in its entirety.

If, during the limited warranty period, this product appears to contain a defect covered by this limited warranty, call 1-800-528-2806, toll free, before dismantling this product. Then send this product, pre-paid and insured, to our service center for warranty repair. You will be advised of shipping instructions when you call. Please include a brief description of the problem and a dated proof-of-purchase receipt with any product returned for warranty repair. Products returned to Seller for warranty repair, which upon receipt by Seller are confirmed to be defective and covered by this limited warranty, will be repaired or replaced (at Seller’s sole option) at no cost to you and returned pre-paid. Defective parts will be repaired or replaced with new or factory-rebuilt parts at Seller’s sole option.

ALL IMPLIED WARRANTIES FOR THE PRODUCT, INCLUDING BUT NOT LIMITED TO ANY IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, ARE LIMITED IN DURATION TO THE TWO year LIMITED WARRANTY PERIOD SET FORTH ABOVE, AND NO IMPLIED WARRANTIES WILL EXIST OR APPLY AFTER SUCH PERIOD. Some states do not allow limitations on how long an implied warranty lasts, so the above limitation may not apply to you. THIS LIMITED WARRANTY DOES NOT COVER NON-DEFECT DAMAGE, DAMAGE CAUSED BY IMPROPER INSTALLATION, OPERATION OR CARE (INCLUDING, BUT NOT LIMITED TO ABUSE, MISUSE, FAILURE TO PROVIDE REASONABLE AND NECESSARY MAINTENANCE, UNAUTHORIZED REPAIRS OR ANY ALTERATIONS TO THIS PRODUCT), LABOR CHARGES FOR REINSTALLING A REPAIRED OR REPLACED UNIT, OR REPLACEMENT OF BATTERIES.

THIS LIMITED WARRANTY DOES NOT COVER ANY PROBLEMS WITH, OR RELATING TO, THE GATE OR GATE HARDWARE, INCLUDING BUT NOT LIMITED TO THE GATE SPRINGS, GATE ROLLERS, GATE ALIGNMENT OR HINGES. THIS LIMITED WARRANTY ALSO DOES NOT COVER ANY PROBLEMS CAUSED BY INTERFERENCE. ANY SERVICE CALL THAT DETERMINES THE PROBLEM HAS BEEN CAUSED BY ANY OF THESE ITEMS COULD RESULT IN A FEE TO YOU.

UNDER NO CIRCUMSTANCES SHALL SELLER BE LIABLE FOR CONSEQUENTIAL, INCIDENTAL OR SPECIAL DAMAGES ARISING IN CONNECTION WITH USE, OR INABILITY TO USE, THIS PRODUCT. IN EVENT SHALL SELLER’S LIABILITY FOR BREACH OF WARRANTY, BREACH OF CONTRACT, NEGLIGENCE OR STRICT LIABILITY EXCEED THE COST OF THE PRODUCT COVERED HEREBY. NO PERSON IS AUTHORIZED TO ASSUME FOR US ANY OTHER LIABILITY IN CONNECTION WITH THE SALE OF THIS PRODUCT.

Some states do not allow the exclusion or limitation of consequential, incidental or special damages, so the above limitation or exclusion may not apply to you. This limited warranty gives you specific legal rights, and you may also have other rights which vary from state to state.
